Chapter 2, Test Banks

Short Answer Questions

1. Describe the characteristics that define a hospital.

Answer - The basic definition of a hospital typically involves providing services clustered around three key terms: observation, diagnosis, and treatment. Observation involves analyzing or studying patients and running tests and checks—all of which ultimately lead to a diagnosis. The diagnosis is the physician's or medical provider's explanation for the cause or source of the problem or symptoms. Treatment is the course of action that the hospital will take to make the patient better, lessen the symptoms, or otherwise care for the patient. All of the services that a hospital provides are typically organized around at least one of these areas.

2. Differentiate between healthcare policies and regulations.

Answer – Policies provide broad guidelines which are used to create specific procedures within a system; whereas, regulations are authorized instructions for how something should be carried out.

3. Discuss how the mission of a hospital differs from other types of organizations.

Answer – Other types of companies typically have a two-prong mission of maximizing profits and satisfying stakeholders, which helps to clearly focus employees and others on efficiencies, revenues, and cost reductions. On the other hand, hospitals offer an intangible product that cannot be easily packaged and sold. hospitals are not profit-maximizing entities, and historically, most have not been overly concerned about negative margins or break-even income statements. Most other organizations focus solely on maximizing the wealth of the owners or shareholders and to a lesser degree on the social or public benefits that are derived

from the production of their goods or services. Additionally, the primary performance outcome of a hospital is measured in terms of “quality,” abstractly measured by a wide range of mortality and morbidity indicators, and not business metrics such as economic value, return on investment, or net income. Finally, hospitals are governed to a large degree by professionals who lack formal training in business management, unlike other firms where those educated and professionally trained in business disciplines clearly govern all aspects of the business. This is one of the primary reasons financial and business implications of key decisions might be secondary in the management decision process of these organizations.
